

Actively Manage AI Risks

Summary

Risks related to AI

1 Company-specific risks

Examples

«Hallucinations»

Wrong answers

Bias

Distorted, controversial
answers

Scalable «attacks»

Fully automated and
therefore scalable
attacks, manipulations
and misuse

Data misuse

Misuse of data that was
shared with AI

Misuse possible by individuals, companies, criminal organisation or even states

2 Social risks

Examples

Unintended multiplication of prejudices and bias

Unintended spread of existing bias by AI, multiplied in a scalable way

Intended manipulation of opinions

Create specific perceptions in the society by scalable AI campaigns (e.g. social media campaigns)

Mass unemployment

Mass unemployment caused by automation which may lead to economic problems, mental health problems and even social and political unrest

3 Existential risks

Examples

Uncontrolled acceleration of scientific research

Significantly accelerated scientific progress may get out of control

Military use

Uncontrollable threat by e.g. killer robots or automated decision-making systems which might cause an unintended chain reaction

Super intelligence

AI becoming superior and dominating, maybe even extinguishing humanity

Some basic guidelines to minimize company-specific risks (1/2)

- 01 Distinguish data you share with AI solutions - highly sensitive data vs. less sensitive data
- 02 Do not share highly sensitive or confidential information with AI (e.g. sensitive employee data, customer data, R&D related product data, trade secrets, software code etc.)
- 03 If possible, make use of company-specific, company-internal AI infrastructures and solutions which protect and do limit data sharing data with external parties

Some basic guidelines to minimize company-specific risks (2/2)

- 04 Challenge and question all results generated by AI to avoid incorrect information caused by AI hallucinations, bias or manipulations
- 05 Do not embed AI-generated results in fully automated process flows in critical areas, otherwise human challenging, questioning and corrections may not be possible which could lead to severe problems
- 06 If possible, AI results should be labeled such that other colleagues can handle them with necessary awareness and care
